FORGOTTEN: This book is intended for physicists and physical chemists, and may
be used by students taking advanced courses in physics and physical chemistry.

COVENECH: This is a collection of articles by members of the Physics Institute
on such subjects as helium-II, polar centers, polarized deuterons in a magnetic
field, effect of gamma-rays on copper oxides, digital computer programs, ex-
haustive air showers, effect of thermal gradient on crystals, and the theory
of heavy unstable particles. The last article, in Georgian, is a brief resume
of the development of physics in Georgia during the past 40 years. Abstracts
in English are given after each article. No personalization are mentioned.
References accompany each article.

53

Chelishvili, O. B., and O. E. Khusidashvili. Behavior of a Polarized
Deuteron Beam in a Magnetic Field
In this article the authors discuss the double elastic scattering
of a deuteron beam in a magnetic field, and obtain the expression
for its angular distribution. It is shown that the angular distribution
varies on scattering amplitude and polarization by means of the experi-
ment in the presence of a magnetic field than without one.

61

Shatashvili, V. V., and O. Sh. Kabanidze. Effect of Gamma Rays on the
Catalytic Activity of Copper Oxides in the Reaction of Hydrogenation
of Ethyl Alcohol
The dependence of the catalytic activity of Cu₂O and CuO on the
radiation dose received by the catalyst is investigated in the
reaction of hydrogenation of ethyl alcohol. The irradiation in-
creases an increase in CuO activity followed by a decrease in its resistance
and a decrease in Cu₂O activity followed by a decrease in its resistance.
The irradiation of the catalyst does not change the mechanism of the reaction.

69

Chavchavadze, V. V., E. B. Sazhuk, and V. A. Kamaishvili. Numeric
Programming Method for Electro-Photon Gamma Calculation by the
Monte Carlo Method With Electronic Computers
The authors present a detailed digital computer program for the
simulation of electro-photon cascade by the Monte Carlo method.
This program is a synthesis of several subroutines each of which is
designed for a specific computational aspect of the cascade pheno-
menon. Each subroutines is compiled separately before a new cascade is
computed. The proposed program can be modified to compute other
problems solved by Monte Carlo method.

131

Edilashvili, M. V. Integral Distribution of the Penetrating Component
of Extensive Air Showers
In this article the author studies the integral distribution of the
penetrating component of extensive air showers with a total number
of particles between 10⁵ and 10¹⁰ in a tunnel at 400 meters above
sea level and depth of 65.5 meters water equivalent. The investigation
was carried out at distances of 1, 10, 20, 30, 40, and 60 meters from
the shower axis.

173

Matinyan, S. O. Certain Problems in the Theory of Heavy Unstable
Particles
This article deals with a theoretical investigation of the pro-
duction of heavy unstable particles. Energy spectra and the
and Λ decays are investigated. Particular attention is given to
production in the reaction $\pi^+ p \rightarrow \pi^+ \Lambda$ and $\pi^+ p \rightarrow \pi^+ \Sigma^+$.
The authors make a detailed study of the decay of Λ and Σ^+ particles.
The calculation of these effects important data may be obtained on the
production of heavy unstable particles and the problem of their interaction
in decays of hyperons. A strong Λ - Σ interaction is applied to

AUTHORS: Chavchanidze, V. V., Shaduri, R. S., Kumsishvili, V. A.

TITLE: The Calculation of the Electron-Photon Cascade in Lead by the Monte Carlo Method (Raschet metodom Monte-Karlo elektronno-fotonnogo kaskada v svintse)

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1958, Vol. 34, Nr 4, pp. 912 - 915 (USSR)

ABSTRACT: This work describes the statistical probability molding based on the method of random trials (a modification of the method by Monte Carlo). This work only describes the scheme of the calculation of the cascade omitting details. The range of the γ -quantum in lead until the first process of interaction is "drawn". The "drawing" is made for the integral curve of the dependence of the total cross section on the energy of the quantum. Then the "fate" of the γ -quantum is drawn. In the case of pair production the energy of the positron is drawn and from it then the energy of the electron is ascertained. Subsequently the amounts of the ionization losses and thus also of the energy of the components of the pair before the following

Card 1/4

The Calculation of the Electron-Photon Cascade in Lead 56-34-4-20/60
by the Monte Carlo Method

collisions are determined. Simultaneously also the correction for the multiple scattering is "drawn". The energy of the bremsstrahlung quantum was ascertained by the method of the construction of non-normalized integral curves with unequal argument scales. The scattering angles were "drawn" without consideration of the correlation between the scattering angles of the quantum of the electron. In the case of destruction the scattering angle of the one γ -quantum in the center of mass system is "drawn". From the data obtained by this also the scattering angle of the second quantum is ascertained. The results thus obtained are plotted in form of curves for the energy distribution and for the angular distribution of the electrons, positrons, and γ -quanta (as functions of the generating angle of the observation cone). The computation of the electron-photon cascade is unusually long. For the factual performance of the computations electronic high-speed computers are necessary. The existing machines need not be rebuilt at all but a correspondingly performed programming is sufficient. Here 2 of such programming methods are shortly described. It is a particularity

Card 2/4

The Calculation of the Electron-Photon Cascade in Lead 56-34-4-20/60
by the Monte Carlo Method

of the first method that in the constant memory the arguments of the given probability functions are stored in a certain order. The second programming method allows the introduction of these functions into the storing device. According to the opinion of the authors the whole efficiency of the calculations by the method of random trials shows up only in case of the application of electronic computers and in case of adapted programming. The authors thank A. V. Tagviashvili, B. I. Bondarevich, L. L. Esakiya, G. A. Goradze, M. Ye. Perel'man, G. A. Almanov for their participation in the practical performance of the computations. This work was performed on the suggestion by Professor V. P. Dzhelepov in connection with the necessary estimation of the probability of the non-emission of electrons and positrons from lead plates of little thickness. The authors thank Professor Dzhelepov and his collaborators for his attentiveness and his interest in this work. There are 3 figures and 7 references, 4 of which are Soviet.

AUTHORS: Chavchanidze, V.V., and Kumsishvili, V.A.

TITLE: Determination of distribution laws on the basis of a small number of observations

PERIODICAL: Referativnyy zhurnal. Avtomatika i radioelektronika, no. 6, 1962, abstract 6-2-166 n (V sb. Primeneniye vychisl. tekhn. dlya avtomatiz. proiz-va, M., Mashgiz, 1961, 129-139)

TEXT: An empirical method is suggested for determining the distribution functions of a random quantity X for the case when the number of measured values of this quantity is small ($n < 10$). The method is based on the use of a-priori notions on the probability-density function $f(x)$. It is assumed that $f(x)$ is a continuous function and that $f(x) \geq 0$ for $a < x \leq b$, while $f(x) = 0$ for $x < a$ and $x > b$, i.e. the interval of possible values of $f(x)$ is finite and known. $f(x)$ is found as the sum of so-called contribution functions multiplied by suitable weighting coefficients. Contribution functions are meant as arbitrary functions constructed in the neighborhood of the observed values.

Card 1/3

Determination of distribution laws ...

S/194/62/000/006/065/232

hood of x_i the probability density is different from zero. The summation of the contribution functions is based on the fact that each of them supplements, and makes more precise the information obtained from the preceding one. The zero-order contribution function $f_0(x)$ represents a uniform distribution of the quantity X , since the statement of the equi-probability of the values x_i does not contradict the preliminary information. The weighting coefficients are chosen to be equal on the assumption of the equivalence of the information obtained from each x_i . For a contribution function having a rectangular form, symmetrical with respect to x_i , the weighting coefficients are chosen equal to $1/(n + 1)$ from a normalization condition. Thus the approximate probability-density function assumes the form

$$f_n(x) = \frac{1}{n + 1} \left\{ f_0(x) + \sum_{i=1}^n \Psi_{x_i}(x) \right\}, \text{ where } \Psi_{x_i}(x) \text{ are the contribu-}$$

Card 2/3

Determination of distribution laws ... S/194/62/000/006/065/232

tion functions. The method given has been tested for two types of probability distributions: the uniform and the gaussian distributions. Results of its comparison with the known classical method for $n = 3; 4; 6; 10$ are given. For each n , $N = 50$ constructions of the probability-density function were carried out. As a measure of the accuracy the quantities η_N and $D\eta$ were taken, where $\eta = \max_x [F(x) - F_n(x)]$, η_N is an averaged value with respect to N , $F(x)$ is the true distribution, F_n is a distribution constructed empirically,

and $D\eta = \left\{ \sum_{i=1}^n (\bar{\eta}_i - \eta_i)^2 / (N - 1) \right\}^{1/2}$. Calculations show that for

small values of n the method of symmetrical contributions gives indisputably better results. The method allows simple execution of calculations on computers. 4 references. [Abstractor's note: Complete translation.]

CITED SOURCE: Tr. In-ta kibernetiki. AN GruzSSR, v. 1, 1963, 25-35

TOPIC TAGS: stochastic process, stochastic process generation, Markov chain generation, stochastic logical generation

TRANSLATION: Generation of stochastic processes, particularly, of a simple homogeneous Markov's chain with a discrete time by means of functions of the algebra of logic is considered. Four generator types developing one and n symbols per unit of time are presented. For each generator, probabilities of p_{ij} - transitions from the i-th state to the j-th state are calculated; the maximum probabilities R_i of the transitions are needed for estimating the process entropy. It is proven that by selecting suitable values of probability of using various logical functions, random processes with the required p_{ij} and R_i can be obtained, i. e., the stochastic process can be controlled in a certain sense. An example is

Title : Speeding up withdrawal of contents of the rumen in cattle

Periodical : Veterinariya, 31, 55-57, Apr 1954

Abstract : Inserting two probes, one into each nostril, is a new method recommended for withdrawing contents of rumen of cattle. This method can be used in emergency cases of overdistention of the rumen and is harmless. Water is poured into one probe and the loosened contents of the rumen pass out through the other probe. This method is superior to any other method that has been in use. Illustrations.

TITLE: On the Convective Component of a Complex Heat Exchange²¹ at High Temperatures²¹

PERIODICAL: Sb. Leningr. in-ta inzh. zh.-d. transp., 1958, Nr 160, pp 234 - 240

ABSTRACT: It has been found that the equations of convective heat emission, derived on the basis of the generalization of experimental data obtained at relatively low temperatures, cannot be applied without experimental checking to the calculation of heat emission in the complex process of heat exchange at relatively high temperatures; if the physical parameters are referred to the average temperature of the flow. In the application of the mentioned equations corrections must be introduced, e.g. in the form of a temperature simplex. It has been noted that the described method of using the equations of convective heat emission is suitable for the calculation of heat emission in the combustion chambers of boilers, in gas turbines and other heat-exchanging installations.

TITLE:

Regenerative Air Heating in Cupolas

PERIODICAL:

Liteynoye proizvodstvo, 1959, Nr 9, pp 27-29 (USSR)

ABSTRACT:

Utilization of cupola outlet gases represents one of the most important factors in increasing foundry productivity. The Iron Foundry imeni Voykov has introduced an air-heating process whereby the outlet gases having a temperature of 500° - 800°C are passing through a number of balls placed in a cylinder (Fig 6). The air-heater is provided with a rotor that has 12 sectors and serves for rotation of the balls. The optimum diameter of balls may vary from 3 to 10 mm depending on the cleanliness of gases passing through them. The function of the air-heater consists of an alternating admission of hot gases and cool air into the cylinder. The gases entering the air-heater are giving a part of their heat to the balls which, in turn, heat up the air passing through the cylinder. Thus, the gases cool off from 800°C to 250°, while the air becomes heated up to 400° - 420°C. Rotation

Card 1/2

SOV/128-59-9-8/25

Regenerative Air Heating in Cupolas

of balls intensifies the process of heat-exchange between the gases and the balls, and favors the rate of air-heating. At the same time, the air-heater serves as a cleaning medium purifying the cupola outlet gases. There are 4 graphs, 6 diagrams and 2 Soviet references.

TITLE: Intercollegiate Conference on the Principle of Similarity
and Its Application in Heat Engineering ✓

PERIODICAL: Inzhenerno-fizicheskiy zhurnal, 1960, Vol. 3, No. 11,
pp. 120-124

TEXT: From June 6 to June 10, 1960, the mezhvuzovskaya konferentsiya po teorii podobiya i yeye primeneniyu v teplotekhniki (Intercollegiate Conference on the Principle of Similarity and Its Application in Heat Engineering) was held at the Moskovskiy institut inzhenerov transporta (MIIT) (Moscow Institute of Transportation Engineers). The Conference was attended by roughly 500 scientific workers. 68 lectures were delivered. After the opening words spoken by the President of the Organization Committee, Deputy Chief of the MIIT, Professor A. I. Ioannisyan, Professor P. K. Konakov (MIIT) began his lecture on "The Present Stage of the Principle of Similarity and the Perspectives of Its Application in Heat Engineering". Academician of the AS BSSR, A. V. Lykov of the Institut

energetiki AN BSSR (Institute of Power Engineering of the AS BSSR) investigated problems of the integral transformations and operator methods and their relations to the principle of similarity. Professor V. A. Venikov of the Moskovskiy energeticheskiy institut (Moscow Institute of Power Engineering), holder of the Lenin Prize, investigated problems concerning the relations between investigations carried out on models, in nature, and analytical investigations. Professor S. G. Teletov of the Institut atomnoy energii AN SSSR im. I. V. Kurchatova (Institute of Atomic Energy of the AS USSR imeni I. V. Kurchatov) in his lecture studied the planning of experimental investigations in correspondence with the demands made by the principle of similarity. According to the opinion of Professor A. A. Gukhman of the Moskovskiy institut khimicheskogo mashinostroyeniya (Moscow Institute of Machine Construction), the most important problem is that of the development of methods, by means of which it is possible to built up the characteristic variables of a physical problem. Professor Ye. V. Kudryavtsev of the ENIN AS USSR attached great importance to the principle of similarity in the investigation of heat exchange processes. Professor L. I. Kudryashchev of the Kuybyshevskiy aviatsionnyy institut

(Kuybyshev Aviation Institute) and Candidate of Technical Sciences
A. G. Temkin of the Kaliningradskiy tekhnicheskii institut rybnoy
promyshlennosti i khozyaystva (Kaliningrad Technical Institute of the
Fisheries and Economics) also delivered lectures which are not dealt with
in detail. The theoretical section of the Conference was under the chair-
manship of Professor Konakov. Here, 17 lectures were delivered. The lecture
by B. V. Kantorovich of the Institut goryuchikh iskopayemykh AN SSSR
(Institute of Fuel Minerals of the AS USSR) had the title "The Application
of the Principle of Similarity in Investigations of Combustion Processes".
The lectures delivered by V. A. Shvab, M. Ye. Dogin of the Tomskiy
elektromekhanicheskiy institut inzhenerov zheleznodorozhnyy transporta
(Tomsk Electromechanical Institute for Railroad Engineers) and by
Z. M. Kudryavtseva of the TsNIIChermet dealt with the application of the
principle of similarity in investigations of the motions of drop-gas
mixtures in pipelines. The lectures delivered by Professor L. I.
Kudryashov (Kuybyshev Aviation Institute) and Professor A. V. Teplov
of the Voyennaya akademiya tyla i transporta (Military Academy for
Supplies and Transportation) dealt with the gas-dynamical simulation of

B019/B056

municipal gas lines. V. M. Golovin (Kuybyshev Aviation Institute) dealt with the estimation of the dissipation of mechanical energy in motions of liquids. V. O. Fogel of the Moskovskiy institut tonkoy khimicheskoy tekhnologii (Moscow Institute of Chemical Technology) investigated the application of the principle of similarity and the electric simulation for the investigation of vulcanization processes. A. V. Temikov (Kuybyshev Aviation Institute) delivered a lecture on "The Similarity of Phenomena of Nonsteady Heat Conduction in Metals". G. P. Ivantsov (TsNIIchermet) dealt with the application of gauge transformations to problems of mathematical physics and heat engineering. A. M. Kulik (Institute of Atomic Energy of the AS USSR imeni I. V. Kurchatov) investigated the application of the principle of similarity to nonsteady temperature fields. Yu. N. Zakharov of the Novosibirskiy institut inzhenerov vodnogo transporta (Novosibirsk Institute for Water-transportation Engineers) investigated the rules governing the functioning of jets. The application of the principle of similarity for the purpose of investigating the nonsteady temperature fields in complex bodies was dealt with by A. G. Temkin. A. M. Shedrin of the Nauchno-issledovatel'skiy institut sel'skogo stroitel'stva (Scientific

Research Institute for Rural Constructions) investigated the application of the principle of similarity to elasticity effects. The section for heat-mass exchange was under the chairmanship of Academician of the AS BSSR A. V. Lykov. Yu. A. Mikhaylov of the Institut energetiki i elektrotehniki AN Latv. SSR (Institute of Power Engineering and Electrotechnics of the AS Latvyskaya SSR) investigated heat-mass exchanges in disperse media. A. V. Ralko of the Kiyevskiy politekhnicheskii institut (Kiyev Polytechnic Institute) investigated the simulation of glowing processes. G. N. Sizov of the Tsentral'nyy nauchno-issledovatel'skiy institut ekonomiki i ekspluatatsii vodnogo transporta (Central Scientific Research Institute for the Productivity and Exploitation of Water Transports) investigated the simulation of the turbulent heat exchange. Z. M. Miropol'skiy of the Mskovskiy lesotekhnicheskii institut (Moscow Institute of Forestry) investigated the heat exchange in the condensation of high tension steam. B. I. Kolbasov (Institute of Atomic Energy of the AS USSR imeni Kurchatov) spoke about the results of an investigation of the heat exchange in the critical region in the flow of carbonic acid in tubes. Most of the lectures were delivered in the section for heat exchange. The section was supervised

by Professor P. N. Pomanenko. Professor A. M. Gurvich of the TsKTI imeni Polzunov reported on research work in the Laboratoriya luchistogo teploobmena TsKTI (Laboratory of Radiation Heat Exchange of the TsKTI) carried out in the course of recent years. Ye. P. Karasev of the Lenin-gradskoye vyssheye voyenno-morskoye inzhenernoye uchilishche im. Dzerzhinskogo (Leningrad Higher Naval Engineering School imeni Dzerzhinskiy) dealt with the simulation of steam aggregates. P. N. Pomanenko investigated the resistance and the heat exchange of a turbulent gas flow in diffuser-channels. V. P. Motulevich of the ENIN AS USSR dealt with the heat exchange and the friction of plates in a gas flow. B. S. Dyachenko of the Nikolayevskiy korablestroitel'nyy institut im. admirala Makarova (Nikolayev Shipbuilding Institut imeni Admiral Makarov) dealt with the estimation of heat exchangers of gas turbines in shipbuilding. V. G. Dorofeyev of the Novocherkasskiy politekhnicheskiy institut (Novocherkassk Polytechnic Institute) gave the results of an investigation of the heat exchange of electrolocomotive resistors. P. M. Brdlik, G. Ye. Verevochkin, and V. A. Smirnov (MIIT, ENIN AS USSR) investigated the heat exchange between jets and plates. Ye. V. Kudryavtsev and K. N. Kachalev (ENIN AS
Card 6/10

Intercollegiate Conference on the Principle of Similarity and Its Application in Heat Engineering S/70/60/003/011/016/016

USSR) investigated the operation of an electronic universal calorimeter. K. F. Aksenov of the Vsesoyuznyy zaochnyy institut inzhenerov transporta (All-Union Correspondence Institute for Transportation Engineers) reported on experimental data concerning a heat exchanger. S. S. Filimonov and B. A. Khrustalev (ENIN AS USSR) reported on thermotechnical investigations of the flow of a liquid through tubes. A. I. Leont'yev (Moscow Institute of Forestry), N. Ye. Ninua of the Gruzinskiy politekhnicheskii institut (Georgian Polytechnic Institute), G. P. Boykov (Tomsk Polytechnic Institute), I. S. Kochenov, and G. Ye. Morozov (Institute of Atomic Energy of the AS USSR imeni I. V. Kurchatov), A. A. Smirnov (Kuybyshev Aviation Institute), and V. G. Ushakov of the Novocherkasskiy politekhnicheskii institut (Novocherkassk Polytechnic Institute) delivered lectures which are mentioned in passing only. The last day was devoted to the works in the Simulation Laboratory of the Kafedra "Teplosilovyye ustanovki" MIITA (Chair of "Thermal Power Plants" of the MIIT). A lecture delivered by P. K. Konakov was on "The Rules of the Complex Heat Exchange". V. T. Kumskov (MIIT) delivered the lecture "An Investigation of the Complex Heat Exchange in Combustion Chambers". V. I. Lebedev reported on

Card 7/10

B019/B056

"An Investigation of the Action of the Degree of Blackening Upon the Heat Exchange in Combustion Chambers". The section for thermal power machines was under the supervision of Professor V. V. Lakhanin (Novosibirsk Institute for Water Transportation Engineers). In his lecture he dealt with a detailed analysis of the heat calculation of piston machines. In this connection, B. Kh. Draganov of the Ukrainskaya akademiya sel'skokhozyaystvennykh nauk (Ukraine Academy of Economics) is mentioned. The collaborators of the Central Scientific Research Institute of Economics and Exploitation of Water Transportation carried out experiments on the application of the principle of similarity for transport calculations. S. N. Dashkov (Military Academy for Supplies and Transportation) spoke about the application of the principle of similarity in the calculation of motorcar engines. M. G. Kruglov and N. P. Kozlov of the MVTU imeni Bauman gave a report on the application of the principle of similarity in the investigation of processes in combustion engines. L. I. Fomkinskiy (Central Scientific Research Institute of Economics and the Exploitation of Water Transportation) investigated the methods of calculating river transportation. B. I. Buber of the Murmanskoye vyssheye morskhdnoye

Card 8/10

Intercollegiate Conference on the Principle of Similarity and Its Application in Heat Engineering S/170/60/003/011/016/016

uchilishche (Murmansk Higher College of Navigation) investigated the optimum operation conditions for steam engines for ships. Ye. A. Nikitin of the Kalomenskiy teplovozostroitel'nyy zavod im. Kuybysheva (Kalomensk Steam Locomotive Factory imeni Kuybyshev) spoke about investigations of compressorless Diesel engines by means of the principle of similarity. M. P. Aleksandrov of the MVTU imeni Bauman applied the principle of similarity to the determination of the heating of braking systems. V. D. Zinevich of the Leningradskiy gornyy institut (Leningrad Mining Institute) investigated pneumatic motors produced by the factory "Pnevmatika" of the Lengorsovnarkhoz on the basis of the principle of similarity. B. Kh. Draganov (Ukraine Academy of Economics) and K. Ye. Ucheshko (Nikolayev Shipbuilding Institute imeni Admiral Makarov) studied the application of the principle of similarity to steam-power engines. The section made decisions concerning the further development of the application of the principle of similarity, which are summarized in form of three points. Furthermore, the senior editor of the "Inzhenerno-fizicheskiy zhurnal", Academician of the AS BSSR A. V. Lykov is requested to publish works on the principle of similarity regularly. Energoizdat is requested to

TEXT: A method of calculating heat exchange in furnace chambers replaces that based on Stefan-Boltzmann's law, which is not convenient for a non-equilibrium state of the medium, as the degree of blackness is very difficult to determine in this case. The proposed new method, based on Konakov uses the experimentally verified assumption that a layer in which molecular and radiant temperatures are equal exists near the heat-perceiving surfaces. Formulas determine during the preliminary design calculations the effective radiative surface of the furnace. There are 3 figures.

Authorized as a textbook by Glavnoye upravleniye uchebnymi zavedeniyami MPS. Reviewer: Docent V. I. Perelt; Editor: Engineer M. Ye. Gritsevskiy; Scientific editor for literature on the locomotive economy: V. A. Drobinskiy; Technical editor: N. A. Khitrova; Proofreader: A. A. Tomilina

TOPIC TAGS: combustion, fuel, gaseous fuel, liquid fuel, solid fuel

PURPOSE AND COVERAGE: This book was intended as a textbook for students in power specializations in higher educational institutions for railroad transport and may be used also by students in other specializations and also by engineers and technicians. A brief characterization of sources of thermal power is given, followed by classifications and the physical-chemical properties of fuels. The physical-chemical bases of the combustion processes are analyzed for solid, liquid, and gaseous fuels. The authors express their gratitude to Docent V. I. Perelt and to the members of the Kafedra "Teplotekhniki" of the Khar'kovskiy Institut Inzhenerov

ABSTRACT: This article gives a short survey of research on composite heat exchange and indicates the trend of this research. This review indicates that the concept of diffuse transfer of radiant energy in absorbent media is fruitful and is used by most research workers. Expressions for the radiant energy transfer vector must be used which account for peculiarities in the spatial distribution of radiation intensity. Use of integral and differential equations for problems of radiant heat exchange gives practically identical results. Boundary layer equations may also be
Card 1/2

L 20851-66

ACCESSION NR: AT5016478

used for problems of radiant heat exchange in absorbing media. Very little experimental research is being done on the mechanism of complex transfer of heat energy by radiation and convection with respect to varying optical density characteristics of the medium. Work is needed in calculating the absorption factor. These considerations may obviously serve as a basis for standard complex heat exchange working formulas in combustion chambers of ovens, boilers and other heat exchange equipment where the transfer of heat energy is accomplished by combined effects of heat conductivity, convection and radiation. Orig. art. has: 8 formulas.

TITLE: X-ray study of minerals of the columbite-tantalite group

SOURCE: Ukraine. Glavnoye upravleniye geologii i okhrany nedr. Rentgenografiya mineral'nogo syr'ya. no. 1, Moscow, 1962, 113-119. Trudy Pervogo Vsesoyuznogo soveshchaniya v Kieve 25-29 sentyabrya 1959 g, 113-119

TEXT: The powder method and a 53.7 mm diameter camera were used to investigate the diffraction patterns of natural specimens of columbite-tantalite. Examination of more than 50 Debye powder patterns disclosed the existence of 7 types of diffraction pattern. The movement of individual lines on the Debye powder patterns may be related to the presence of impurities, detected in the samples studied, and not to the variable concentration of Mn and Fe. Data for a specimen with 9.6% Sn showed that, in comparison with the Debye powder

pattern of normal columbite-tantalite, numerous additional reflections appeared as the diffraction pattern became generally weaker. There was no cassiterite phase. Roasting at temperatures of up to 1200°C did not alter the diffraction pattern. The stability of tin-tantalite during roasting may be due to the fact that Sn forms isomorphous mixtures with Ta and Nb at high temperatures. There are 2 figures and 2 tables.
